Bayesian Adjustment for Multiplicity

MONDAY, April 11, 2011, at 4:00PM
133 Eckhart Hall, 5734 S. University Avenue
*Refreshments following the seminar in Eckhart 110.*

ABSTRACT

Issues of multiplicity in testing are increasingly being encountered in a wide range of disciplines, as the growing complexity of data allows for consideration of a multitude of possible hypotheses (e.g., does gene \( xyz \) affect condition \( abc \)); failure to properly adjust for multiplicities is possibly to blame for the apparently increasing lack of reproducibility in science. Bayesian adjustment for multiplicity is interesting, in that it occurs through the prior probabilities assigned to models/hypotheses. It is, hence, independent of the error structure of the data, the main obstacle to adjustment for multiplicity in non-Bayesian statistics.

Not all assignments of prior probabilities adjust for multiplicity, however, and assignments in huge model spaces typically require a mix of subjective assignment and appropriate hierarchical modeling. These issues will be reviewed through a variety of examples. If time permits, some surprising issues will also be discussed, such as the fact that empirical Bayesian approaches to multiplicity adjustment can be problematical.
